CST Storage Launches “HydroTec MB” Mobile Temporary Storage Tank

LENEXA, Kan. (May 29, 2013) – Beginning today, a versatile, more reliable and cost-effective solution is available to exploration companies with above ground temporary liquid storage needs.

CST Storage, the global leader in engineered and factory coated storage solutions, announces the launch of “HydroTec MB,” an innovative pre-engineered portable storage system with unmatched structural integrity.

HydroTec MB features a chime panel epoxy coated tank design with gaskets as a frame, and a single or double covered 40mil form-fit LLDPE liner that is bolted to the tank.

The liner is attached to the tank with a

proven, engineered connection used currently with biogas storage systems. No C-clamps or makeshift attachments are used. Available for capacities from 4,700 bbl to more than 42,700 bbl, HydroTec MB tanks may be constructed on site in as little as two to four days. Grounded in approved design standards and priced competitively, HydroTec MB is a reusable solution that features a small footprint with vertical capacity. Pre-engineered for use with a dome or cover, HydroTec MB may be designed with one or two rings.

HydroTec MB is a mobile temporary storage tank. Built on grade so minimal site prep is required, HydroTec MB tanks are expandable, portable and adaptable. In most cases, permits are not required for transportation and construction of HydroTec MB. Construction on site is safe and fast, by trained customer personnel or by professional certified CST Storage teams. CST Storage features the integrity and experience from 120+ years in business and more than 250,000 units constructed worldwide. All HydroTec MB tanks are manufactured at ISO Certified facilities in the U.S. using a Trico-Bond EP epoxy coating system for long-term durability.

Rugged and reliable, HydroTec MB tanks provide a responsible, eco-friendly solution and an overall better environmental choice. HydroTec MB tanks feature minimal inventory needs and easy repair solutions due to their precision engineering and modular design. They also feature a nozzle application through the sidewall.
